

Dipl. Gymnast Reinhard Geber
Owner of SPOREG

Results

Following the assessment of the cross-section and longitudinal-section analyses of the study, the following can be said regarding the Andullation Therapy System:

- ▶ patient's spinal column mobility is considerably improved
- ▶ tension in deep muscle areas is released
- ▶ a positive redistribution in the bodily fluid system occurs (stimulation of the lymph system)
- ▶ the patient's subjective perception of pain is reduced.

The medical hhp Andullation Therapy System is an extremely innovative product and valuable for the preservation of good health.

It can be used with all age groups and is also ideally suited for home use. It is effective in treating existing symptoms but also preventively to preserve health.

The Outpatient Rehabilitation Center

Excerpt from the study about the physiological effect of the hhp Andullation Therapy System on the human organism

In Germany, over 40 million people suffer from more or less acute back pain and this number is on the rise.

Pain medication becomes the last resort for many. For years, the SPOREG firm has been active in the areas of rehabilitation and therapy. Their extensive knowledge is based in part on the treatment of professional athletes from almost all types of sports. SPOREG has made it their job to seek alternatives to traditional medicine.

They have been using the hhp Andullation Therapy System for over 2 years now. The initial positive assessments from patients following use have led them to examine the mat's effectiveness in a scientific study. The results are convincing in many aspects. In alternative medicine, the hhp Andullation Therapy System not only plays an important role in therapy and rehabilitation, but also in prevention in particular.

Study design

Within the framework of a modular scientific study design, 40 randomly chosen back pain patients were randomised, divided into and examined in two groups of 20 test subjects in an initial cross-section analysis. These two subgroups were subjected to the following trial approach:

Group with oscillation and infrared deep heat with the hhp Andullation Therapy System:	20 test subjects
Placebo group (no treatment):	20 test subjects

Four Points were examined:

- 1. Subjective pain assessment**
- 2. Body fluid analysis**
- 3. Analysis of trunk mobility**
- 4. Registration of the resting tone of the back muscles**

20 test subjects were subjected to a 15 min. application with the Andullation Therapy System set on a standardized programme.

The object of the study:
The hhp Andullation Therapie System

20 test subjects were subjected to a 15 min. application with the Andullation Therapy System set on a standardized programme.
